Chapter 1. General

1.1. About this document

This document is a part of an overall specification series [19]. Each part specifies the contents of a Submodel Template (SMT). The specifications of the Asset Administration Shell (AAS) are the basis for the Submodel Template specifications, see [6].

The target audience of the specification are developers and editors of technical documentation and manufacturer information, which are describing assets by means of the Asset Administration Shell (AAS) and therefore need to create a Submodel instance with a hierarchy of SubmodelElements. This document especially details on the question, which SubmodelElements with which semantic identification shall be used for this purpose.

This specification was created following the "model based workflow" as defined in [18]. Additionally, Aspect Models were created [15,16].

1.2. Scope of the Submodel

This Submodel template aims to define the data points of a Battery Passport conformant to DIN DKE SPEC 99100 and the corresponding EU regulations.

The battery passport consists of the following 7 parts:

```
Digital Battery Passport - Part 1: Digital Nameplate (IDTA-02035-1)
Digital Battery Passport - Part 2: Handover Documentation (IDTA-02035-2)
Digital Battery Passport - Part 3: Product Carbon Footprint (IDTA-02035-3)
Digital Battery Passport - Part 4: Technical Data (IDTA-02035-4)
Digital Battery Passport - Part 5: Product Condition (IDTA-02035-5)
Digital Battery Passport - Part 6: Material Composition (IDTA-02035-6)
Digital Battery Passport - Part 7: Circularity (IDTA-02035-7)
```

This specification is Part 4: Technical Data (IDTA-02035-4).

1.3. Relevant standards for the Submodel template

This submodel template fulfills the requirements for technical data attributes as defined in DIN DKE SPEC 99100 [14]. DIN DKE 99100 "is based on the European Union and key Member States current regulatory requirements for battery passport information. Mandatory information for the battery passport as stated in the EU Battery Regulation (EU)2023/1542, Article77 and AnnexXIII, as well as the Ecodesign for Sustainable Products Regulation (ESPR), is supplemented by recommendations to increase sustainability and circularity. [14]"

This document is valid for all battery categories. Please be aware that for battery categories that have stronger requirements like industrial batteries with battery management systems etc. some of the data points are specified as optional although mandatory per regulation.

1.4. Explanations on used UML diagrams

For clarity and an improved legibility readers suggested to go through this section at first before reading the

following chapters.

UML diagrams feature box-like elements, called "classes". These classes, typically Submodels, SubmodelElementCollections or SubmodelElementLists, typically feature a set of Properties or further SubmodelElements. These elements can have specific cardinalities.

The single classes are hierarchally organized by aggregation relations, these can be seen as "contains" relation.

For a further overview on UML diagrams please refer to [6, 19] and [10].

Further details about used table formats please refer to Annex A.

Chapter 2. Information set for Submodel ”TechnicalData”

2.1. General

The "Technical Data 1.0" Submodel Template is part of the specification series for the Battery Passport.

The Submodel template is an instance of the Submodel template "Generic Technical Data 2.0 Submodel Template (IDTA-02003-2-0)" with battery specific extensions in the GeneralInformation SMC. Another deviation: SML TechnicalPropertyAreas is modelled as SMC.

The submodel instance `Technical Data` is used to provide all static (model) technical based data attributes of a battery as declared in the DIN DKE SPEC 99100, exceptions are carbon footprint, materials, and circularity (each have their own submodels, see Section 1.2).

Property specification

See clause 3 "Information structures and attributes".

Figure 1 shows the UML-diagram defining the relevant properties which need to be set.

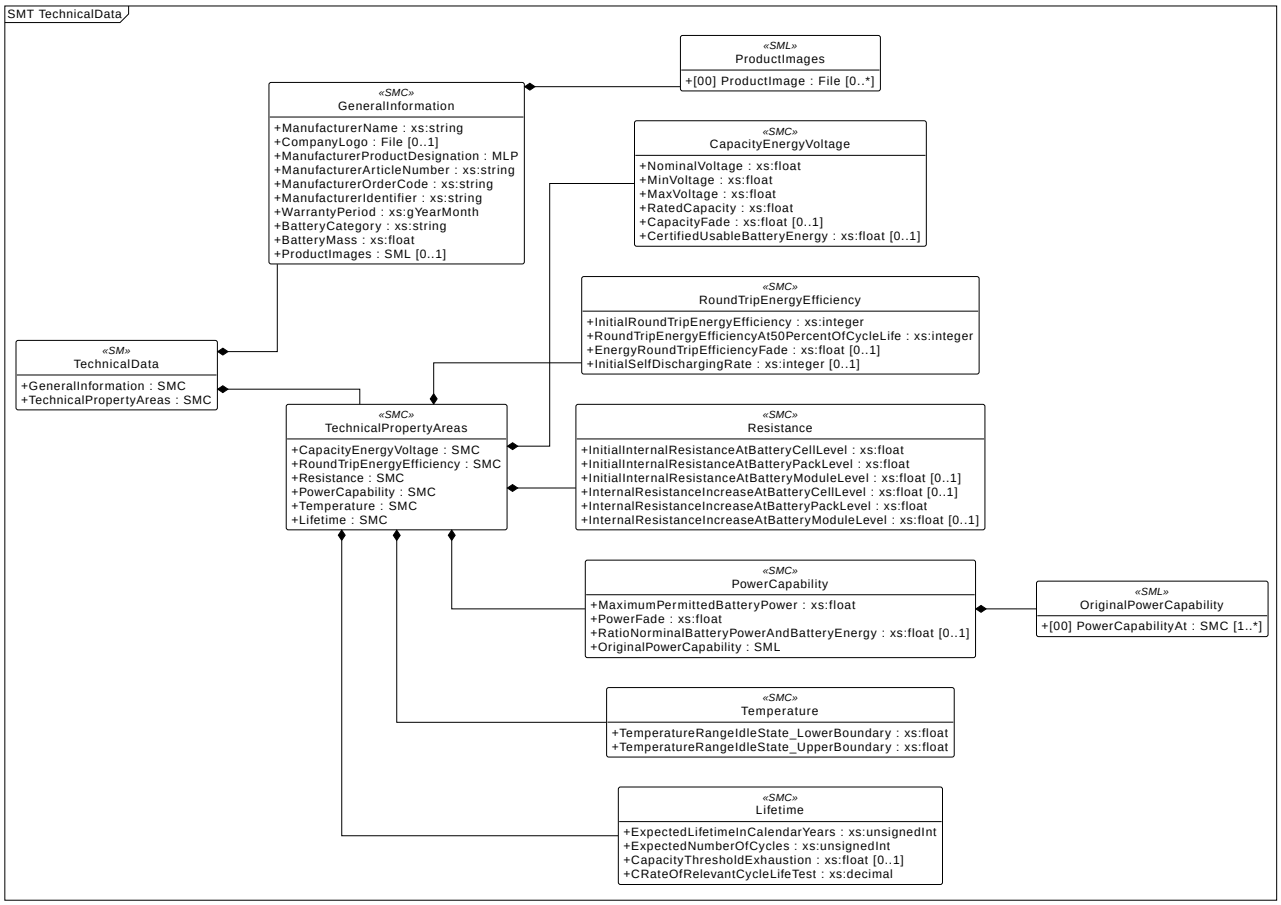

Figure 1. UML-Diagram for Submodel "Technical Data" for batteries

2.2. Submodel TechnicalData

The SubmodelElementCollection (SMC) “TechnicalData” contains general information around a battery. The table convention is explained in Annex A.2.

2.4. SubmodelElements of TechnicalPropertyAreas

The following attributes need to be set for the Submodel instance. The table convention is explained in Annex A.2.

The ECLASS IRDIs referenced in this Submodel are based on ECLASS Release 15. This version of the Submodel with these ECLASS IRDIs is also available in the download area of the ECLASS website: www.eclass.eu in form of the Asset.xml. The Asset.xml (Release 15) is the ECLASS file that contains Submodels. The use of these Submodels is free of charge.

[Prop] atSoc	urn:samm:io.admin-shell.idta.batterypass.technical_data:1.0.0#atSoC supplementalSemanticId: 0173-1#02-ABL821#001 Power capability shall be measured at reference conditions, which must include measurements at 80% and 20% state of charge for EV and industrial batteries.	[UnsignedInt] 80	1
[Prop] powerCapabilityAt	urn:samm:io.admin-shell.idta.batterypass.technical_data:1.0.0#powerCapabilityAt supplementalSemanticId: 0173-1#02-ABL853#001 Power capability.	[Float] 500	1

2.9. SubmodelElements of Temperature

The SubmodelElementCollection (SMC) “Temperature” contains temperature relevant data elements. The table convention is explained in Annex A.2.

Table 11. SubmodelElements of Temperature

idShort:	**Temperature**
Class:	SubmodelElementCollection

semanticId:	urn:samm:io.admin-shell.idta.batterypass.technical_data:1.0.0#temperature		
Parent:	TechnicalPropertyAreas		
Explanation:	Information regarding temperature conditions. DIN DKE Spec 99100 chapter reference: 6.7.7		
Element details:	-		
[SME type] idShort	semanticId Description@en	[valueType] example	card.
[Prop] TemperatureRangeIdleState_LowerBoundary	0173-1#02-ABL842#002 supplementalSemanticId: urn:samm:io.admin-shell.idta.batterypass.technical_data:1.0.0#temperatureRangeIdleStateLowerBoundary lower boundary of the surrounding temperature range, which the battery can safely withstand temperature range idle state (lower boundary) DIN DKE Spec 99100 chapter reference: 6.7.7.3	[Float] -19	1
[Prop] TemperatureRangeIdleState_UpperBoundary	0173-1#02-ABL871#002 supplementalSemanticId: urn:samm:io.admin-shell.idta.batterypass.technical_data:1.0.0#temperatureRangeIdleStateUpperBoundary upper boundary of the surrounding temperature range, which the battery can safely withstand temperature range idle state (upper boundary) DIN DKE Spec 99100 chapter reference: 6.7.7.4	[Float] 49	1

2.10. SubmodelElements of Lifetime

The SubmodelElementCollection (SMC) “Lifetime ” contains lifetime relevant data elements. Some other lifetime relvant information will be provided in the • Digital Battery Passport - Part 2: Handover Documentation 1.0 (IDTA-02035-2). The table convention is explained in Annex A.2.

Table 12. SubmodelElements of Lifetime

idShort:	**Lifetime**
Class:	SubmodelElementCollection
semanticId:	urn:samm:io.admin-shell.idta.batterypass.technical_data:1.0.0#lifetime
Parent:	TechnicalPropertyAreas
Explanation:	Information regarding battery lifetime. DIN DKE Spec 99100 chapter reference: 6.7.6

Element details:	-		
[SME type] idShort	semanticId Description@en	[valueType] example	card.
[Prop] ExpectedLifetimeInCalendarYears	urn:samm:io.admin-shell.idta.batterypass.technical_data:1.0.0#expectedLifetime The battery passport must include information about the expected battery lifetime in calendar years. The update interval must be upon placement on the market and upon change of the battery status. DIN DKE Spec 99100 chapter reference: 6.7.6.2	[UnsignedInt] 15	1
[Prop] ExpectedNumberOfCycles	urn:samm:io.admin-shell.idta.batterypass.technical_data:1.0.0#expectedNumberOfCycles supplementalSemanticId: 0173-1#02-ABL830#001 Expected battery lifetime expressed in cycles. The exception for non-cycle applications in Article 10 appears sensible, but is not included in the Annex XIII provision. The data attribute is defined by measurement conditions of the cycle-life test such as the C-Rate (see below) and the depth of discharge in the cycle-life test DIN DKE Spec 99100 chapter reference: 6.7.6.3	[UnsignedInt]	1
[Prop] CapacityThresholdExhaustion	0173-1#02-ABL838#002 supplementalSemanticId: urn:samm:io.admin-shell.idta.batterypass.technical_data:1.0.0#capacityThresholdForExhaustion interpreted as minimum percentage of rated capacity, above which the battery is still considered operational as EV battery in its current life. The value has to be provided by the economic operator. This metric may serve as indicator for a necessary end of current life as EV and may be understood in the context of warranty. interpreted as minimum percentage of rated capacity, above which the battery is still considered operational as EV battery in its current life. The value has to be provided by the economic operator. This metric may serve as indicator for a necessary end of current life as EV and may be understood in the context of warranty. DIN DKE Spec 99100 chapter reference: 6.7.6.9	[Float] 23	0..1

[Prop] CRateOfRelevantCycleLifeTest	urn:samm:io.admin-shell.idta.batterypass.technical_data:1.0.0#cRateLifeCycleTest The C-rate should be provided separately for both the charge and discharge of the battery, if applicable. The exception for non-cycle applications as mentioned in "Expected lifetime: Number of charge-discharge cycles" should apply to this data attribute as well. DIN DKE Spec 99100 chapter reference: 6.7.6.6 This data attribute is a measurement parameter for “Expected lifetime: Number of charge-discharge cycles”: Applied charge and discharge rate in terms of rated capacity (C-rate) of relevant cycle-life reference test. DIN DKE Spec 99100 chapter reference: 6.7.6.6	[Decimal]	1

Annex A. Explanations on used table formats

1. General

The used tables in this document try to outline information as concise as possible. They do not convey all information on Submodels and SubmodelElements. For this purpose, the definitive definitions are given by a separate file in form of an AASX file of the Submodel template and its elements.

2. Tables on Submodels and SubmodelElements

For clarity and brevity, a set of rules is used for the tables for describing Submodels and SubmodelElements.

- The tables follow in principle the same conventions as in [5].
- The table heads abbreviate 'cardinality' with 'card'.
- The tables often place two informations in different rows of the same table cell. In this case, the first information is marked out by sharp brackets [] form the second information. A special case are the semanticIds, which are marked out by the format: (type)(local)[idType]value.
- The types of SubmodelElements are abbreviated (see Table 13):

Table 13. Abbreviations for SubmodelElements

SME type	SubmodelElement type
Blob	Blob
Cap	Capability
Ent	Entity
Evt	Event
File	File
MLP	MultiLanguageProperty
Opr	Operation
Prop	Property
Range	Range
Ref	ReferenceElement
Rel	RelationshipElement
RelA	AnnotatedRelationshipElement
SMC	SubmodelElementCollection
SME	SubmodelElement type
SML	SubmodelElementList

- If an idShort ends with '__00__', this indicates a suffix of the respective length (here: 2) of decimal digits, in order to make the idShort unique. A different idShort might be choosen, as long as it is unique in the parent's context.
- The Keys of semanticId in the main section feature only idType and value, such as: https://admin-shell.io/vdi/2770/1/0/DocumentId/Id. The attribute "type" (typically "ConceptDescription" and "(local)" or

"GlobalReference") need to be set accordingly; see [6].

- If a table does not contain a column with "parent" heading, all represented attributes share the same parent. This parent is denoted in the head of the table.
- Multi-language strings are represented by the text value, followed by '@'-character and the ISO 639 language code: example@EN.
- The [valueType] is only given for Properties.
