

# IDTA 02035-6: Digital Battery Passport – Part 6 Material Composition

February 2026

## SPECIFICATION

Submodel Template of the  
Asset Administration Shell

Submodel Template

**IDTA** approved

- 100% AAS compliant
- Consistent & interoperable
- Released by the AAS experts

# IDTA 02035-6 V1.0

## Imprint

Publisher

Industrial Digital Twin Association  
Lyoner Strasse 18  
60528 Frankfurt am Main  
Germany

# Chapter 1. General

## 1.1. About this document

This document is a part of an overall specification series [4]. Each part specifies the contents of a Submodel Template (SMT). The specifications of the Asset Administration Shell (AAS) are the basis for the Submodel Template specifications, see [3].

The target audience of the specification are developers and editors of technical documentation and manufacturer information, which are describing assets by means of the Asset Administration Shell (AAS) and therefore need to create a Submodel instance with a hierarchy of SubmodelElements. This document especially details on the question, which SubmodelElements with which semantic identification shall be used for this purpose.

This specification was created following the "semantic-driven workflow" as defined in [5] based on Aspect Models [6]. There is no central dictionary or repository for Aspect Models. In this specification the following sources are used for defining semantics:

- Aspect Models published at IDTA [7]: <https://github.com/admin-shell-io/smt-semantic-models>, models with namespace "io.admin-shell"
- Aspect Models published by the BatteryPass Consortium (closed project) [8]: <https://github.com/batterypass/BatteryPassDataModel>, models with namespace "io.BatteryPass"
- Aspect Models published at Tractus-X and used in standards published by Catena-X [9]: <https://github.com/eclipse-tractusx/sldt-semantic-models>, models with namespace "io.catenax"

## 1.2. Scope of the Submodel

This Submodel template aims to define the material composition data points of a Battery Passport conformant to DIN DKE SPEC 99100 and the corresponding EU regulations.

The battery passport consists of the following 7 parts:

Digital Battery Passport - Part 1: Digital Nameplate (IDTA-02035-1)  
Digital Battery Passport - Part 2: Handover Documentation (IDTA-02035-2)  
Digital Battery Passport - Part 3: Product Carbon Footprint (IDTA-02035-3)  
Digital Battery Passport - Part 4: Technical Data (IDTA-02035-4)  
Digital Battery Passport - Part 5: Product Condition (IDTA-02035-5)  
Digital Battery Passport - Part 6: Material Composition (IDTA-02035-6)  
Digital Battery Passport - Part 7: Circularity (IDTA-02035-7)

This specification is Part 5: Material Composition (IDTA\_02035-6).

## 1.3. Relevant standards for the Submodel Template

This submodel template fulfills the requirements for dynamic data attributes as defined in DIN DKE SPEC 99100 [1]. DIN DKE SPEC 99100 "is based on the European Union and key Member States current regulatory requirements for battery passport information. Mandatory information for the battery passport as stated in the EU Battery Regulation (EU)2023/1542, Article77 and AnnexXIII, as well as the Ecodesign for Sustainable Products Regulation (ESPR), is supplemented by recommendations to increase sustainability and circularity. [1]"

This document is valid for all battery categories. Please be aware that for battery categories that have stronger requirements like industrial batteries with battery management systems etc. some of the data points are specified as optional although mandatory per regulation.

## 1.4. Explanations on used UML diagrams

For clarity and an improved legibility readers suggested to go through this section at first before reading the following chapters.

UML diagrams feature box-like elements, called "classes". These classes, typically Submodels, SubmodelElementCollections or SubmodelElementLists, typically feature a set of Properties or further SubmodelElements. These elements can have specific cardinalities.

The single classes are hierarchically organized by aggregation relations, these can be seen as "contains" relation.

For a further overview on UML diagrams please refer to [2] and [3].

Further details about used table formats please refer to Annex A Explanations.

# Chapter 2. Information set for Submodel "MaterialComposition"

## 2.1. General

The "Material Composition" Submodel Template is part of the specification series for the Battery Passport.

### Property specification

See clause 3 "Information structures and attributes".

## 2.2. Overview UML model

The SubmodelElements described in section 3 are structured in the following way (see Figure 1):

Figure 1. UML overview

# Chapter 3. Information structures and attributes

## 3.1. Properties of the Submodel “Material Composition”

Figure 2 shows the UML-diagram defining the relevant properties which need to be set.

Figure 2. UML-Diagram for Submodel "MaterialComposition"

|                           |  |                      |       |

| [Prop]<br>ComponentName | urn:samm:io.admin-shell.idta.batterypass.material_composition:1.0.0#componentName<br><br>Name of component.         | [String]<br><br>Anode | 0..1  |
| [Prop]<br>ComponentId   | urn:samm:io.admin-shell.idta.batterypass.material_composition:1.0.0#componentId<br><br>Identifier of the component. | [String]              | 0..1  |

# Annex A. Explanations on used table formats

## 1. General

The used tables in this document try to outline information as concise as possible. They do not convey all information on Submodels and SubmodelElements. For this purpose, the definitive definitions are given by a separate file in form of an AASX file of the Submodel template and its elements.

## 2. Tables on Submodels and SubmodelElements

For clarity and brevity, a set of rules is used for the tables for describing Submodels and SubmodelElements.

- The table heads abbreviate 'cardinality' with 'card'.
- The tables often place two informations in different rows of the same table cell. In this case, the first information is marked out by sharp brackets [] form the second information.
- The types of SubmodelElements are abbreviated (see [Table 1](#)):

*Table 1. Abbreviations for SubmodelElements*

| SME type | SubmodelElement type         |
|----------|------------------------------|
| Blob     | Blob                         |
| Cap      | Capability                   |
| Ent      | Entity                       |
| Evt      | Event                        |
| File     | File                         |
| MLP      | MultiLanguageProperty        |
| Opr      | Operation                    |
| Prop     | Property                     |
| Range    | Range                        |
| Ref      | ReferenceElement             |
| Rel      | RelationshipElement          |
| RelA     | AnnotatedRelationshipElement |
| SMC      | SubmodelElementCollection    |
| SME      | SubmodelElement              |
| SML      | SubmodelElementList          |

- Multi-language strings are represented by the text value, followed by '@'-character and the ISO 639 language code: example@EN.
- The [valueType] is only given for Properties.

# **Annex B. Changes to the submodel template**

## **General**

This annex lists the changes from version to version of the Submodel, together with major changes in the overall document.

## **Changes Version 1.0**

- First Version conformant to DIN DKE SPEC 99100
